# Monotonicity results in an epigraph

## Theorem (B., Farina, Sciunzi, 2025)

*Let  $\Omega$  be a globally Lipschitz continuous epigraph bounded from below.*

*Assume  $f \in \text{Lip}([0, +\infty))$  with  $f(0) \geq 0$  and let  $u \in C^0(\overline{\Omega}) \cap H_{loc}^1(\overline{\Omega})$  be a distributional solution to (NPE) such that for any  $R > 0$ , there are positive numbers  $A = A(R), B = B(R)$  such that*

$$u(x) \leq Ae^{B|x|} \quad \forall x \in \Omega \cap \{x_N < R\}.$$

*Then  $u$  is strictly increasing in the  $x_N$ -direction, i.e.,  $\frac{\partial u}{\partial x_N} > 0$  in  $\Omega$ .*

## Comments

1- If  $f \in Lip_{loc}([0, +\infty))$  and  $u$  is bounded on finite strips, that is, for any  $R > 0$ ,

$$\exists C(R) > 0, \quad u(x) \leq C(R) \quad \forall x \in \Omega \cap \{0 < x_N < R\}.$$

then the theorem holds true.

# Comments

1- If  $f \in Lip_{loc}([0, +\infty))$  and  $u$  is bounded on finite strips, that is, for any  $R > 0$ ,

$$\exists C(R) > 0, u(x) \leq C(R) \quad \forall x \in \Omega \cap \{0 < x_N < R\}.$$

then the theorem holds true.

2- If  $f$  is not locally Lipschitz continuous then the previous theorem does not hold.

$f$   $\alpha$ -h lder ( $0 < \alpha < 1$ )

## On a bounded domain

### Theorem (Serrin, 1971)

*Let  $\Omega$  be a bounded domain whose boundary is of class  $C^2$ . If there exists a function  $u \in C^2(\overline{\Omega})$  satisfying (SOP) then  $\Omega$  must be a ball and  $u$  is radially symmetric about its center.*

## On a bounded domain

### Theorem (Serrin, 1971)

*Let  $\Omega$  be a bounded domain whose boundary is of class  $C^2$ . If there exists a function  $u \in C^2(\overline{\Omega})$  satisfying (SOP) then  $\Omega$  must be a ball and  $u$  is radially symmetric about its center.*

Physical motivations : Suppose we have a viscous incompressible fluid moving in a straight pipe with a given cross section  $\Omega$ . The flow velocity  $u$  depends only on  $(x, y)$  variables and solves

$$\begin{cases} -\Delta u = A & \text{in } \Omega, \\ u > 0 & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega, \end{cases}$$

Then the tangential stress is the same at each point of the boundary (i.e.  $\frac{\partial u}{\partial \eta} = (\nabla u, \eta) = c$  on  $\partial\Omega$ .) if and only if  $\Omega$  is a ball.

## On a bounded domain

### Theorem (Serrin, 1971)

*Let  $\Omega$  be a bounded domain whose boundary is of class  $C^2$ . If there exists a function  $u \in C^2(\overline{\Omega})$  satisfying (SOP) then  $\Omega$  must be a ball and  $u$  is radially symmetric about its center.*

Physical motivations : Suppose we have a viscous incompressible fluid moving in a straight pipe with a given cross section  $\Omega$ . The flow velocity  $u$  depends only on  $(x, y)$  variables and solves

$$\begin{cases} -\Delta u = A & \text{in } \Omega, \\ u > 0 & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega, \end{cases}$$

Then the tangential stress is the same at each point of the boundary (i.e.  $\frac{\partial u}{\partial \eta} = (\nabla u, \eta) = c$  on  $\partial\Omega$ .) if and only if  $\Omega$  is a ball.

Question : What is the situation when  $\Omega$  is an unbounded domain ?

## On epigraph with Allen-Cahn type nonlinearity

Theorem (Beresticky-Caffarelli-Nirenberg, 1997)

If  $g \in C^2$  is a globally Lipschitz-continuous function such that

$$\forall \tau \in \mathbb{R}^{N-1}, \quad \lim_{|x'| \rightarrow +\infty} (g(x' + \tau) - g(x')) = 0.$$

and problem (SOP) admits a smooth and bounded solution with  $f$  an *Allen-Cahn type* function.

Then  $g$  must be constant (i.e.,  $\Omega = \{x \in \mathbb{R}^N : x_N > \text{const.}\}$  is an upper half-space) and  $u$  takes the form  $u = u(x_N)$ .

# On epigraph with Allen-Cahn type nonlinearity

Theorem (Berestycki-Caffarelli-Nirenberg, 1997)

If  $g \in C^2$  is a globally Lipschitz-continuous function such that

$$\forall \tau \in \mathbb{R}^{N-1}, \quad \lim_{|x'| \rightarrow +\infty} (g(x' + \tau) - g(x')) = 0.$$

and problem (SOP) admits a smooth and bounded solution with  $f$  an **Allen-Cahn type** function.

Then  $g$  must be constant (i.e.,  $\Omega = \{x \in \mathbb{R}^N : x_N > \text{const.}\}$  is an upper half-space) and  $u$  takes the form  $u = u(x_N)$ .

# On epigraph with Allen-Cahn type nonlinearity

## Theorem (Beresticky-Caffarelli-Nirenberg, 1997)

If  $g \in C^2$  is a globally Lipschitz-continuous function such that

$$\forall \tau \in \mathbb{R}^{N-1}, \quad \lim_{|x'| \rightarrow +\infty} (g(x' + \tau) - g(x')) = 0.$$

and problem (SOP) admits a smooth and bounded solution with  $f$  an **Allen-Cahn type** function.

Then  $g$  must be constant (i.e.,  $\Omega = \{x \in \mathbb{R}^N : x_N > \text{const.}\}$  is an upper half-space) and  $u$  takes the form  $u = u(x_N)$ .

Example :

$$f(x) = x - x^3.$$

# Conjecture

## Conjecture (Beresticky-Caffarelli-Nirenberg, 1997)

*If  $\Omega$  is a smooth domain with  $\Omega^c$  connected and that there is a bounded positive solution of (SOP) for some Lipschitz function  $f$  then  $\Omega$  is either a half space, or a cylinder  $\Omega = B_k \times \mathbb{R}^{n-k}$ , where  $B_k$  is  $k$ -dimensional Euclidean ball, or the complement of a ball or a cylinder.*

# Conjecture

## Conjecture (Beresticky-Caffarelli-Nirenberg, 1997)

*If  $\Omega$  is a smooth domain with  $\Omega^c$  connected and that there is a bounded positive solution of (SOP) for some Lipschitz function  $f$  then  $\Omega$  is either a half space, or a cylinder  $\Omega = B_k \times \mathbb{R}^{n-k}$ , where  $B_k$  is  $k$ -dimensional Euclidean ball, or the complement of a ball or a cylinder.*

In our case, the conjecture becomes

## Conjecture

*If  $\Omega$  is a smooth enough epigraph and that there is a bounded positive solution of (SOP) for some Lipschitz function  $f$  then  $\Omega$  is a half space.*

## Theorem (Del Pino, Pacard, Wei (2014))

Let  $f \in C^1([0, +\infty))$  such that

$$f(0) = 0 = f(1), \quad f(s) > 0 \quad \forall s \in (0, 1), \quad f'(1) < 0.$$

If  $N \geq 9$  then there exist an epigraph  $\Omega$  which is not a half space, such that that the problem

$$\left\{ \begin{array}{ll} -\Delta u = f(u) & \text{in } \Omega, \\ 0 < u \leq 1 & \text{in } \Omega, \\ u = 0 & \text{on } \partial\Omega, \\ \frac{\partial u}{\partial \eta} = (\nabla u, \eta) = c & \text{on } \partial\Omega. \end{array} \right.$$

Remark : This epigraph is not globally Lipschitz continuous.

### Theorem (Farina, Valdinoci, 2009)

*Let  $N = 2, 3$  and  $f$  be an Allen-cahn type function.*

*Let  $\Omega$  be an open epigraph of  $\mathbb{R}^N$  with  $C^3$  and globally Lipschitz boundary.*

*Suppose that  $u \in C^2(\overline{\Omega}) \cap L^\infty(\Omega)$  satisfies (SOP).*

*Then, we have that  $\Omega = \mathbb{R}_+^N$  up to isometry and that there exists  $u_0 : (0, +\infty) \rightarrow (0, +\infty)$  in such a way that*

$$u(x_1, \dots, x_N) = u_0(x_N) \quad \text{for any } (x_1, \dots, x_N) \in \Omega.$$

- 1 Recall
  - Presentation of the problem
  - Monotonicity results in an epigraph
- 2 Serrin's overdetermined problem in epigraph
  - Presentation of the problem
  - Some classic results
  - Flattening and symmetry results
- 3 Serrin's overdetermined problem if  $f(0) < 0$ 
  - Monotonicity results if  $f(0) < 0$
  - Symmetry results for  $f(0) < 0$
  - In other dimensions
  - Stables solutions

## Case $N = 2$

### Theorem (B., Farina, 2025)

*Let  $\Omega \subset \mathbb{R}^2$  be a globally Lipschitz-continuous epigraph bounded from below and with boundary of class  $C^3$  and let  $u \in C^1(\overline{\Omega}) \cap C^2(\Omega)$  be a solution to (SOP).*

*Assume that  $f(0) \geq 0$  and one of the following hypotheses holds true :*

**(H1)**  $f \in Lip_{loc}([0, +\infty))$ , and  $\nabla u \in L^\infty(\Omega)$  ;

## Case $N = 2$

### Theorem (B., Farina, 2025)

Let  $\Omega \subset \mathbb{R}^2$  be a globally Lipschitz-continuous epigraph bounded from below and with boundary of class  $C^3$  and let  $u \in C^1(\overline{\Omega}) \cap C^2(\Omega)$  be a solution to (SOP).

Assume that  $f(0) \geq 0$  and one of the following hypotheses holds true :

(H1)  $f \in Lip_{loc}([0, +\infty))$ , and  $\nabla u \in L^\infty(\Omega)$  ;

(H2)  $\begin{cases} f \in Lip([0, +\infty)), & f(t) \leq 0 \text{ in } (0, +\infty), \\ u(x) = o(|x| \ln^{\frac{1}{2}} |x|), & \text{as } |x| \rightarrow \infty. \end{cases}$

Then,  $\Omega = \mathbb{R}_+^2$  up to a vertical translation and there exists  $u_0 : [0, +\infty) \rightarrow (0, +\infty)$  strictly increasing such that

$$u(x) = u_0(x_2) \quad \forall x \in \mathbb{R}_+^2.$$

## Important lemma for the proof

### Theorem (B., Farina, 2025)

Let  $\Omega \subset \mathbb{R}^N$  be a domain of class  $C^3$ . Let  $f \in Lip_{loc}([0, +\infty))$  and let  $u \in C^2(\Omega) \cap C^1(\overline{\Omega})$  be a solution to (SOP) such that

$$\int_{B(0,R) \cap \Omega} |\nabla u|^2 = o(R^2 \ln R) \quad \text{as } R \longrightarrow \infty. \quad (1)$$

If  $u$  is monotone, i.e.,

$$\frac{\partial u}{\partial x_N}(x) > 0 \quad \forall x \in \Omega, \quad (2)$$

then,  $\Omega = \mathbb{R}_+^N$  up to isometry and there exists  $u_0 : [0, +\infty) \rightarrow (0, +\infty)$  strictly increasing such that

$$u(x) = u_0(x_N) \quad \forall x \in \mathbb{R}_+^N.$$

# Comments

- There is no restriction on the sign of  $f(0)$ .

## Comments

- There is no restriction on the sign of  $f(0)$ .
- $\Omega$  is not necessarily a epigraph.

## Comments

- There is no restriction on the sign of  $f(0)$ .
- $\Omega$  is not necessarily a epigraph.
- The previous Lemma does holds true in any dimensions.

## Comments

- There is no restriction on the sign of  $f(0)$ .
- $\Omega$  is not necessarily a epigraph.
- The previous Lemma does holds true in any dimensions.
- The previous Lemma stills true when  $\Omega = \mathbb{R}_+^N$  even if the Neumann condition is not assumed, and in  $\mathbb{R}^N$ .  
 $\Rightarrow$  The symmetry result stays true when  $\Omega$  is an half-space.

## Comments

 $\Rightarrow$  The symmetry result stays true when  $\Omega$  is an half-space.
- We observe that if conditions on  $\nabla u$  or on  $u$  are not satisfy then our symmetry result does not hold. Indeed If we take  $u(x) = x_2 e^{x_1}$  then  $u$  satisfies

$$\begin{cases} -\Delta u = -u & \text{in } \mathbb{R}_+^2, \\ u > 0 & \text{in } \mathbb{R}_+^2, \\ u = 0 & \text{on } \partial\mathbb{R}_+^2. \end{cases}$$

## Case $N = 3, 4$

### Theorem (B., Farina (2025))

Let  $N = 3, 4$  and  $\Omega \subset \mathbb{R}^N$  be a globally Lipschitz-continuous epigraph bounded from below and with boundary of class  $C^3$  and let  $u \in C^1(\overline{\Omega}) \cap C^2(\Omega)$  be a solution to (SOP).

Assume that  $f(0) \geq 0$  and

$$(A1) \quad \begin{cases} f \in Lip([0, +\infty)), & f(t) \leq 0 \quad \text{in } (0, +\infty), \\ u(x) = o(|x|^{\frac{4-N}{2}} \ln^{\frac{1}{2}} |x|), & \text{as } |x| \rightarrow \infty. \end{cases}$$

Then,  $\Omega = \mathbb{R}_+^N$  up to a vertical translation and there exists  $u_0 : [0, +\infty) \rightarrow (0, +\infty)$  strictly increasing such that

$$u(x) = u_0(x_N) \quad \forall x \in \mathbb{R}_+^N.$$

We define

$$F(t) = \int_0^t f(s) ds$$

Theorem (B., Farina (2025))

Let  $N = 3$  and  $\Omega \subset \mathbb{R}^N$  a smooth enough epigraph bounded from below .  
 Let  $f \in C^1([0, +\infty))$  with  $f(0) \geq 0$  and  $u$  a bounded solution to (SOP).  
 Suppose that

$$\sup_{t \in [0, \sup_{\Omega} u]} F(t) = F(\sup_{\Omega} u). \quad (3)$$

Then,  $\Omega = \mathbb{R}_+^N$  up to isometry and there exists  $u_0 : [0, +\infty) \rightarrow [0, +\infty)$  strictly increasing such that

$$u(x) = u_0(x_N) \quad \forall x \in \Omega.$$

Remark : If  $N = 2$ , then theorem does hold true (without (3)) since

$$0 < u \leq M \Rightarrow \nabla u \text{ is bounded in } \Omega.$$

## Comments

- Assumption (3) is natural since if  $\Omega = \mathbb{R}_+^N$  then

$$F(\sup_{\Omega} u) > F(t) \quad \text{for any } t \in [0, \sup_{\Omega} u)$$

## Comments

- Assumption (3) is natural since if  $\Omega = \mathbb{R}_+^N$  then

$$F(\sup_{\Omega} u) > F(t) \quad \text{for any } t \in [0, \sup_{\Omega} u)$$

- (3) is satisfied if
  - 1  $f(t) \geq 0$ , for any  $t \geq 0$ .
  - 2 There exists  $\zeta > 0$ , such that  $f(t) \geq 0$  on  $[0, \zeta]$  and  $f(t) \leq 0$  on  $[\zeta, +\infty)$ .
  - 3 There exists  $0 < \zeta_1 < \zeta_2$  such that  $f(t) \geq 0$  in  $[0, \zeta_1]$ ,  $f(t) \leq 0$  in  $[\zeta_1, \zeta_2]$  and  $f(t) > 0$  in  $(\zeta_2, +\infty)$ .

### Theorem (B., Farina, 2025)

Let  $\Omega \subset \mathbb{R}^2$  be a smooth enough epigraph bounded from below and let  $u \in C^1(\overline{\Omega}) \cap C^2(\Omega)$  be a solution to (SOP).

Assume that one of the following hypotheses holds true :

(H1)  $f \in Lip_{loc}([0, +\infty))$ , and  $\nabla u \in L^\infty(\Omega)$ ;

(H2)  $\begin{cases} f \in Lip([0, +\infty)), & f(t) \leq 0 \text{ in } (0, +\infty), \\ u(x) = o(|x| \ln^{\frac{1}{2}} |x|), & \text{as } |x| \rightarrow \infty. \end{cases}$

Then,  $\Omega = \mathbb{R}_+^2$  up to a vertical translation and there exists  $u_0 : [0, +\infty) \rightarrow (0, +\infty)$  strictly increasing such that

$$u(x) = u_0(x_2) \quad \forall x \in \mathbb{R}_+^2.$$

## Theorem (B., Farina (2025))

Let  $N = 3$  and  $\Omega \subset \mathbb{R}^N$  a smooth enough epigraph bounded from below. Let  $f \in C^1([0, +\infty))$  and  $u$  a bounded solution to (SOP). Suppose that

$$\sup_{t \in [0, \sup_{\Omega} u]} F(t) = F(\sup_{\Omega} u).$$

Then,  $\Omega = \mathbb{R}_+^N$  up to isometry and there exists  $u_0 : [0, +\infty) \rightarrow [0, +\infty)$  strictly increasing such that

$$u(x) = u_0(x_N) \quad \forall x \in \Omega.$$

## Theorem (B., Farina (2025))

Let  $N = 3$  and  $\Omega \subset \mathbb{R}^N$  a smooth enough epigraph bounded from below. Let  $f \in C^1([0, +\infty))$  and  $u$  a bounded solution to (SOP). Suppose that

$$\sup_{t \in [0, \sup_{\Omega} u]} F(t) = F(\sup_{\Omega} u).$$

Then,  $\Omega = \mathbb{R}_+^N$  up to isometry and there exists  $u_0 : [0, +\infty) \rightarrow [0, +\infty)$  strictly increasing such that

$$u(x) = u_0(x_N) \quad \forall x \in \Omega.$$

- No assumption on the sign of  $f(0)$ .
- There are always assumptions about  $u$ .
- Just for dimensions  $N = 2$  or  $3$ .

## Theorem (Work in progress)

Let  $u \in C^2(\overline{\mathbb{R}_+^2})$  be a solution of (NPE) where  $f \in Lip_{loc}([0, +\infty))$ . Assume that there exists positive constants  $\eta, K, c, \sigma$  such that

$$f(s) \geq cs^{1+\sigma} - K, \quad s \geq 0 \quad (4)$$

and

$$sf'(s) \geq (1 + \eta)f(s) - K, \quad s \geq 0. \quad (5)$$

Then there exists  $u_0 : [0, +\infty) \rightarrow [0, +\infty)$  such that

$$u(x, y) = u_0(y) \quad \text{for any } (x, y) \in \mathbb{R}_+^2.$$

## Comments

- No assumption on  $u$ .

## Comments

- No assumption on  $u$ .
- Farina and Sciunzi proved that solutions of (NPE) in  $\mathbb{R}_+^2$  are increasing in the  $x_N$  direction, independently of the sign of  $f(0)$  (see [7]).

# Stables solutions

## Definition

A solution  $u$  of  $-\Delta u = f(u)$  in an open set  $\Omega \subset \mathbb{R}^N$  is stable if for every  $\phi \in C_c^1(\Omega)$  there holds

$$\int_{\Omega} f'(u) \phi^2 \leq \int_{\Omega} |\nabla \phi|^2.$$

# Stables solutions

## Definition

A solution  $u$  of  $-\Delta u = f(u)$  in an open set  $\Omega \subset \mathbb{R}^N$  is stable if for every  $\phi \in C_c^1(\Omega)$  there holds

$$\int_{\Omega} f'(u) \phi^2 \leq \int_{\Omega} |\nabla \phi|^2.$$

## Proposition

*If  $\frac{\partial u}{\partial x_N} > 0$  in  $\Omega$  then  $u$  is stable in  $\Omega$ .*

## Theorem (Work in progress)

Let  $2 \leq N \leq 9$  and  $u \in C^2(\overline{\mathbb{R}_+^N})$  be a stable solution of (NPE), where  $f \in C^1([0, +\infty))$  is a non-negative, non-decreasing and convex function.

Then, either

-  $u \equiv 0$  and  $f(0) = 0$ ,

or,

- there exists  $\alpha > 0$  such that

$$u(x) = \alpha x_N \quad \text{for any } x \in \mathbb{R}_+^N.$$

Remarks :

▪ If  $u(x) = x_N^2$  then  $-\Delta u = -2$  and  $f = -2$  is non-decreasing and convex.

## Theorem (Work in progress)

Let  $2 \leq N \leq 9$  and  $u \in C^2(\overline{\mathbb{R}_+^N})$  be a stable solution of (NPE), where  $f \in C^1([0, +\infty))$  is a non-negative, non-decreasing and convex function.

Then, either

-  $u \equiv 0$  and  $f(0) = 0$ ,

or,

- there exists  $\alpha > 0$  such that

$$u(x) = \alpha x_N \quad \text{for any } x \in \mathbb{R}_+^N.$$

Remarks :

▪ If  $u(x) = x_N^2$  then  $-\Delta u = -2$  and  $f = -2$  is non-decreasing and convex.

▪ If  $u(x) = \sqrt{x_N}$  then  $-\Delta u = \frac{1}{4u^3}$  in  $\mathbb{R}_+^N$ . (other theory since  $f$  is not defined at 0).

## Result in $\mathbb{R}^N$

### Theorem (Work in progress)

Let  $2 \leq N \leq 4$  and  $u \in C^2(\mathbb{R}^N)$  a stable solution of  $-\Delta u = f(u)$  in  $\mathbb{R}^N$ . Assume that  $f \in Lip_{loc}(\mathbb{R})$  and :

$$\left\{ \begin{array}{l} \exists \zeta \in \mathbb{R} \text{ such that } \left\{ \begin{array}{ll} f(t) \leq 0 & \text{on } (-\infty, \zeta), \\ f(t) \geq 0 & \text{on } (\zeta, +\infty). \end{array} \right. \\ |u(x)| = o(|x|^{\frac{4-N}{2}} \ln^{1/2} |x|) \text{ as } |x| \rightarrow +\infty. \end{array} \right.$$

Then there exists  $u_0 : \mathbb{R} \rightarrow \mathbb{R}$  such that, up to a rotation,

$$u(x) = u_0(x_N) \quad \text{for any } x \in \mathbb{R}^N.$$

## Remarks

- No assumption on the sign of  $u$ .

## Remarks

- No assumption on the sign of  $u$ .
- $f$  can changes sign. Note that if  $f$  satisfies

$$\exists \zeta \in \mathbb{R} \text{ such that } \begin{cases} f(t) \geq 0 & \text{on } (-\infty, \zeta), \\ f(t) \leq 0 & \text{on } (\zeta, +\infty). \end{cases}$$

## Remarks

- No assumption on the sign of  $u$ .
- $f$  can changes sign. Note that if  $f$  satisfies

$$\exists \zeta \in \mathbb{R} \text{ such that } \begin{cases} f(t) \geq 0 & \text{on } (-\infty, \zeta), \\ f(t) \leq 0 & \text{on } (\zeta, +\infty). \end{cases}$$

- The growth assumption is important. Indeed, If  $u(x) = x_N e^{x_1}$  then  $-\Delta u = -u$  in  $\mathbb{R}^N$  and  $u$  is stable.

## Remarks

- No assumption on the sign of  $u$ .
- $f$  can changes sign. Note that if  $f$  satisfies

$$\exists \zeta \in \mathbb{R} \text{ such that } \begin{cases} f(t) \geq 0 & \text{on } (-\infty, \zeta), \\ f(t) \leq 0 & \text{on } (\zeta, +\infty). \end{cases}$$

- The growth assumption is important. Indeed, If  $u(x) = x_N e^{x_1}$  then  $-\Delta u = -u$  in  $\mathbb{R}^N$  and  $u$  is stable.
- The stability is necessary. Indeed, If  $u(x) = x_N \sin(x_1)$  then  $-\Delta u = u$  in  $\mathbb{R}^N$  but  $u$  is unstable.
